

## REMARKS

Claims 1, 2, 4-6, 10-13 have been rejected under 35 U.S.C. §102(b) as being anticipated by Pollitt, WO 98/44033. Claims 1-8, 11-16 have been rejected under 35 U.S.C. §102(b) as being anticipated by Pollitt, GB 2,322,630. Additionally, claims 1-5, 9, 11-13 have been rejected under 35 U.S.C. §102(b) as being anticipated by Pollitt, WO 98/21159.

The Examiner's rejections are respectfully traversed.

As amended, the Applicant's invention is directed to a settable mixture comprising polybutadiene, a flow-enhancing liquid, and dry particulate matter. The dry particular matter includes no more than 2% water content and is selected to have a maximum of 2% Aluminium Oxide, and a maximum of 1% Ferrous Oxide.

It is important in the Applicant's mixture that there be a maximum of 2% aluminium oxide and a maximum of 1% of the ferrous oxide based on weight of the sand. The specific low percentages were determined by the Applicant during attempts to solve a problem of the Applicant's originally constituted product. As indicated in the previous amendment, it was found that an undesirable oily sheen was left on the paving elements with which the mixture was used for pointing after the product has been stored in vacuum-sealed bags for some four to five weeks. Additionally, the setting times for the mixture increased dramatically from two and half hours to seven or eight hours. This is particularly undesirable since the compound "cures" upon exposure to the atmosphere, and it can not be subjected to rainfall until it has cured. Thus, the longer setting time makes it more difficult to use in conditions where rain may be expected.

The Applicant recognized that the staining of the surrounding pavement may be prevented by minimizing the content of aluminium oxide and ferrous oxide in the sand

mixture. Furthermore, by minimizing these two constituents, the setting time was shortened and the overall strength of the product was improved. The staining of the pavement and increased setting times are unacceptable problems and thus the Applicant overcame the problem by using sands selected to have a maximum of 2% aluminium oxide and a maximum of 1% ferrous oxide content.

It is important to note that if one were to order a silica sand without specifying the chemical constituents thereof it is probable, if not certain, that one would receive a sand with an excessive content of aluminium oxide and possibly a ferrous oxide. As indicated on the attached sheets, the content of aluminium oxide and ferrous oxide can vary greatly. In some instances the aluminium oxide are over 2% and some show almost 10%. Thus, if one used some of these sand products, the invention would not work.

On the other hand, the three cited references do not suggest or disclose the chemical compound as defined in the claims. None of the references mention the aluminium oxide or ferrous oxide content of the particular material. The Applicant points out that there is always some of both constituents in sands. Therefore, the Applicant in the present invention is not attempting to claim a settable material in which the sand has zero aluminium oxide or ferrous oxide. Rather, the Applicant is claiming that specific limitations must be imposed on the percentages of the constituents in order to prevent staining and improve setting times and overall strength. Additionally, at the times when those references were filed, there was no knowledge of the Applicant's problem and thus, no solution to the problem.

As independent claim 1 is patently distinguishable from the prior art references, the remaining claims dependent therefrom are also patently distinguishable.

In view of the foregoing, it is believed that the amended claims and the claims dependent there from are in proper form. The Applicants respectfully contend that Pollitt, WO 98/44033, Pollitt, GB 2,322,630 and Pollitt, WO 98/21159 do not anticipate the claimed invention under the provisions of 35 U.S.C. § 102(b). Thus, claims 1-9 and 11-13 are considered to be patently distinguishable over the prior art of record.

The application is now considered to be in condition for allowance, and an early indication of same is earnestly solicited.

Respectfully submitted,

## The Chemical Makeup

**Padstow Sea Sand** is a calcium enriched liming agent providing a constant plant food supply - ideal for lawn dressing, crops & plants which require light, well-drained soil.

**Padstow Sea Sand** is used for equestrian centres as well, due to its soft texture and natural surface, it is ideal for training horses.

## SILICA SAND OF MOL

After mining, the silica sands of Mol - **M31**, **M32** and **M34** - are industrially processed: sieved, washed and classified. These qualities are available moist or dried; by truck, wagon or ship; in bulk or bagged (dried sands).

**The silica sands of Mol** are an excellent raw material for the glass-, crystal- and ceramic industry, for foundries, for tile glues, plasters, mortars, coatings etc...

## SILICA SAND MAM1S

After mining, the silica sand **MAM1S** is industrially processed, sieved, washed and classified after which it undergoes a chemical purification and a demineralization by flotation.  
**MAM1S** is available either moist or dried.  
Supplies, in bulk, are made by ship or by truck.

## FEATURES AND BENEFITS

EMMETT, ID

**GRANUSIL®** Mineral Fillers are produced from high purity industrial quartz sands for a wide variety of industrial and contractor mixed applications which need a reliable silica contribution or require a chemically inert structural filler. Consistently uniform grain shapes and particle size distributions offer excellent placement, compaction and mechanical properties. High silica content combined with low level soluble ions, alkalis and alkaline oxides provide non-reactive service in most corrosive and exposed environments.

These durable monocrystalline structures resist abrasion in high traffic-excessive wear applications and provide the stability formulators seek in high solids emulsions, elastomerics, cemented and modified cementitious systems. **GRANUSIL®** is the preferred structural component in systems ranging from polymerized floor overlays to artificial sports turf.

All **GRANUSIL®** grades are processed and sized under rigid SPC and UNIMIN QIP<sup>SM</sup> statistical and quality assurance programs. The result is chemical purity and consistently uniform particle size distributions for predictable performance in either manufactured or site-prepared products.

#### Other Properties:

Acid Solubility: 0.4-0.6% - PH: 7.4 Specific Gravity 2.65 Hardness (MoH's Scale): 7.0

## Warning !!

Industrial Sand products contain free silica. Do Not breathe dust.

Prolonged, unprotected exposure may cause delayed lung injury(silicosis).

IARC studies have found limited evidence of lung cancer in humans.

Follow OSHA Safety and Health standards for crystalline silica (quartz).
